every six months. This greatly reduces the chances of someone gaining unauthorized access to your accounts. You can also turn on two-factor authentication whenever possible. This adds an extra layer of security by requiring a second form of verification, such as a code sent to your phone. Taking these simple actions can significantly enhance your data privacy and security.

Recognizing Scams and Security Threats

Phishing is a trick that people use to steal your personal information. A common example is receiving an email that looks like it's from your bank, asking you to click a link and verify your account. The link often leads to a fake website that looks real, and entering your details can give scammers access to your finances. Look closely at the sender's email address; sometimes, it's slightly misspelled or uses unusual domain names. If you receive a phone call from someone asking for your information, remember that no legitimate company will ask for personal details over the phone. Hang up and call the number on their official website if you're unsure. Trust your instincts. If something feels off, it probably is.

Scammers often target older adults because they may be less familiar with technology and more trusting. One typical scam involves a phone call from someone claiming to be from a health organization, offering fake health services. They may ask for your Medicare number, saying it's necessary for a new card or benefits. It's important to know that official organizations
